

Control Over Associating Objects

- Enable legacy records to be kept up-to-date.
- Allow routing, dns, etc to be managed by an inetnum maintainer when directly related to inetnum.
- inetnum holders should have an ability to maintain their own associated records.
- Continue to leverage RIPE NCC for roll-backs, disputes, or failure of sanity checks (cases where block sizes and resource records do not match).
- Enable block holders to keep their db entries accurate while providing similar self-service capabilities already provided to non-legacy blocks.
